Senior Product Manager, Google

Let’s discuss the problems now…

We have 3 problems from 3 different industries

1. Healthcare – "VitalsLink: Chronic Care Recovery Agent"

2. Corporate/HR – "InterviewSync: The Panel Orchestrator"

3. Personal Finance – "SaveSmart: Adaptive Budgeting Agent"

Every team has to select one problem and work upon it.

VitalsLink:

Chronic Care Recovery Agent

Problem statement:

Patients recovering from major surgeries or managing chronic conditions (like Hypertension) often have complex daily protocols involving medication, physical therapy, and diet. When a patient misses a dose or reports a symptom (e.g., "I feel dizzy"), static reminders fail to provide the necessary medical reasoning to adjust the rest of the day's schedule safely.

Build an **agentic AI care assistant** for a single patient that:

- Ingests daily care protocols (meds, therapy, diet) and real-time patient feedback.
- Generates a safe, personalized daily schedule for medications and activities.
- Agentic Twist: Adjusts the plan live when the patient reports a symptom or misses a critical task — e.g., "If dizziness is reported → skip physical therapy, push medication timing, and alert the family".

Constraints:

- Use the persona: "Mr. Kapoor, 68, recovering from heart surgery in Delhi. Lives with his son. Not very comfortable with technology."
- Focus on 1-day plan generation and 1–2 replanning events triggered by symptoms or missed tasks.

Expected outputs:

- UI: Patient dashboard with a daily timeline, "Report Symptom" button, and "Task Complete" toggle — designed for elderly usability (large text, simple actions).
- Agent workflow that:
  - Accepts the day's medical protocol, patient constraints, and real-time inputs.
  - Produces a timestamped schedule with clear reasoning (e.g., "Taking BP meds before walk because...").
  - Can replan when given input like "I feel dizzy" or "I missed my 10 AM dose" — with visible reasoning steps.

Sample Data

Evaluation criteria

Area	Marks	What “good” looks like
Problem & Persona	20	Sharp understanding of elderly tech habits, health risks, and caregiver dependency. Clear persona limitations.
Product & UX	20	Clean day-view dashboard; large, accessible UI elements; easy symptom reporting and task completion flow.
Agentic Flow & Tech	30	Feasible multi-step medical reasoning: symptom input → risk assessment → schedule adjustment → family alert. Logic is visible and explainable.
Pitch & Storytelling	20	Engaging "day in the life of Mr. Kapoor" narrative; live demo showing the moment the plan adapts to a reported symptom.
Process & Metrics	10	KPIs like medication adherence rate, time-to-replan, caregiver alert accuracy, or "patient confidence score."

InterviewSync:
The Panel Orchestrator

Problem statement

HR coordinators spend hours firefighting interview schedules during high-stakes "Super Day" hiring events. When a senior VP cancels a 2:00 PM interview slot at 1:45 PM, the entire candidate experience and panel sequence for the day collapses — and the coordinator is left scrambling with emails and calls.

Build an **agentic AI panel orchestrator** that manages a full day of interviews:

- Ingests panel member availability, candidate time slots, interviewer expertise, and room assignments.
- Generates an optimized "Super Day" interview schedule with panel-candidate pairings.
- Agentic Twist: Automatically reshuffles the remaining interviews when one interviewer reports an "Emergency Meeting" — finds a backup interviewer by department relevance and seniority, and notifies all affected parties.

Constraints:

- Use the persona: "Aditi, HR Lead at a fast-growing startup in Bengaluru. Managing 8 candidates and 12 interviewers across 3 interview rooms for one Super Day."
- Focus on 1-day scheduling and 1–2 disruption events (cancellations or room conflicts).

Expected outputs:

- UI: Master dashboard showing panel-candidate pairings in a timeline/grid view, with a "Report Disruption" trigger (e.g., "VP Rahul cancelled 2 PM slot").
- Agent workflow that:
  - Accepts interviewer profiles, candidate slots, and scheduling constraints.
  - Produces an optimized schedule with clear pairing logic ("Matched based on backend expertise").
  - Can replan when given a disruption — finds the next best backup interviewer, swaps slots, and drafts notification messages for affected candidates and panelists.

Sample Data

Evaluation criteria

Area	Marks	What “good” looks like
Problem & Persona	20	Clear understanding of HR coordination chaos — time pressure, stakeholder management, and candidate experience risks.
Product & UX	20	Intuitive grid/timeline view of the day; easy disruption reporting; clear "before vs. after" visualization of the reshuffled schedule.
Agentic Flow & Tech	30	Multi-step reasoning: disruption detected → constraint check → backup interviewer match → slot swap → notification draft. Logic is transparent.
Pitch & Storytelling	20	Compelling "Agentic Moment" narrative — demonstrating how the agent saves a candidate's interview day in real time.
Process & Metrics	10	KPIs like time-to-reshuffle, candidate wait-time reduction, interviewer utilization rate, or "zero-gap" schedule score.

SaveSmart:
Adaptive Budgeting Agent

Problem statement

Traditional budgeting apps tell you what you spent, but they don't help you adjust your future behavior when an emergency strikes. If a user has a ₹5,000 emergency car repair, they don't know which specific future "wants" to cut to stay on track for their month-end savings goal.

Build an **agentic AI financial** co-pilot for a single user that:

- Accepts a monthly savings goal, income details, and a categorized budget (Needs, Wants, Savings).
- Tracks spending against the budget and flags when the user is at risk of overshooting.
- Agentic Twist: When the user inputs "Unexpected Expense: ₹5,000," the agent identifies 3 specific "Trade-off" scenarios to get back on track — e.g., "Skip dining out for 2 weeks" or "Postpone the sneaker purchase".

Constraints:

- Use the persona: "Rohan, 25, working his first job in Pune. Earning ₹45,000/month. Trying to save ₹1,50,000 in 6 months for his first bike."
- Use static sample data for transactions. No real bank connections needed.

Expected outputs:

- UI: "Goal Progress" bar that shifts in real-time, categorized spending view, and a "Trade-off Scenarios" panel that appears when an unexpected expense is entered.
- Agent workflow that:
  - Classifies spending into 4–6 categories (Rent, Food, Transport, Entertainment, etc.).
  - Runs multi-step reasoning: "Expense > Remaining Surplus? → Check 'Wants' category → Propose specific cuts with timelines."
  - Generates 3 actionable trade-off scenarios ranked by impact and feasibility, with a clear recommendation.

Sample Data

Evaluation criteria

Area	Marks	What “good” looks like
Problem & Persona	20	Realistic portrayal of a young earner's financial stress — EMIs, peer pressure spending, savings anxiety. Clear persona motivations.
Product & UX	20	Visual goal tracker, clean category breakdown, easy "log unexpected expense" interaction. Low cognitive load for a non-finance user.
Agentic Flow & Tech	30	Multi-step agent: budget ingestion → spending classification → surplus check → trade-off generation → recommendation. Reasoning is visible in outputs.
Pitch & Storytelling	20	Story of the "salary-credited-to-broke" cycle; live demo showing the goal bar shift and trade-off scenarios appearing after an emergency expense.
Process & Metrics	10	KPIs like monthly savings rate, "stress reduction score," plan adherence rate, or number of overshoot events prevented.

Submission Guidelines

Presentation

Presentation

- Presentations will happen in Masai office tomorrow. It will be started by **3:30 PM**.
- There would be 2 panels and the team would be assigned to one of them.
- Complete team has to present in front of the jury members.
- **Top 3 teams** will get exciting prices 🤩

Lastly, your mentors will be with you for guidance and support in Day-2
